one having a brown, duſky, granulated line, on the inner ſide; which is the male flower.

On the creeping ſtem, in the centre of theſe tufts of leaves, the ſeed-veſſels are produced; they are about the ſize of a pepper-corn, and of the ſame figure; at firſt green; when at full growth of a brown colour, and covered with a ſhort hairy ſhagginess; they are divided into four cells, and filled with ſmall, brown, globular ſeeds. When the plant dries it changes to a browniſh colour.

Grows in wet ſands, in places ſometimes overflowed with freſh water. It grows in ſeveral parts of *Wales*, and, as is ſaid, on *Honſlow-Heath*; and is in perfection in July.

ISOETIS.
